1 Logistic Regression

1.1 Implementation

We implemented L_2 -regularized logistic regression using gradient descent.

1.2 Testing in data with $\lambda = 0$

We test the logistic regression

Table 1: Estimated logistic regrecoefficients

Data	w_0	w_1	$\overline{w_2}$
stdev1	-66.3378	95.2461	101.1527
stdev2	-0.0466	0.7636	1.1148
stdev4	-0.0093	0.2363	0.2034
nonsep	0.0006	-0.0247	-0.0237

2 Support Vector Machine

Support Vector Machines are a popular classification method to construct linear or nonlinear decision boundaries by solving a convex optimization problem. There are two common forms of the optimization problem considered for SVM, which we refer to as the primal and dual. In this paper, we only consider the dual form, because it is computationally more tractable for many problems, and this method has the ability to generalize to different choices of kernel. The dual form of SVM for a general kernel function $k: \mathcal{X} \times \mathcal{X} \to \mathbb{R}$ is as follows:

$$\max_{\alpha \in \mathbb{R}^{n}} \quad \sum_{i=1}^{n} \alpha_{i} - \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} \alpha_{i} \alpha_{j} y^{(i)} y^{(j)} k(x^{(i)}, x^{(j)})$$
s.t. $0 \le \alpha_{i} \le C$, $i = 1, \dots, n$, (1)
$$\sum_{i=1}^{n} \alpha_{i} y^{(i)} = 0.$$

2.1 Implementation

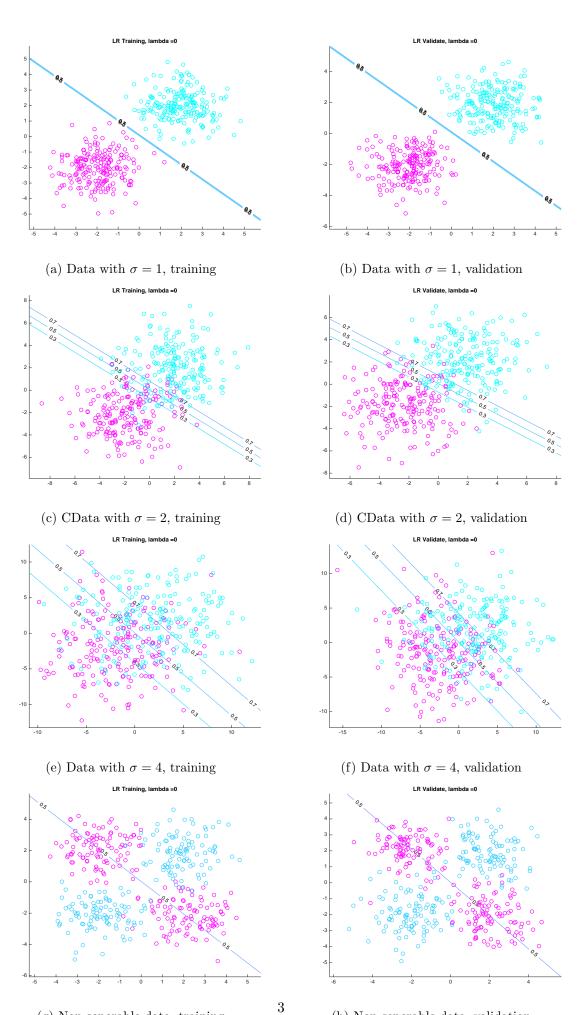

First, we implemented the dual form of the SVM with a linear kernel, where k is the usual dot product $k(x,z) = \langle x,z \rangle$ for all $x,z \in \mathcal{X}$. In MATLAB, we created a function with inputs: data $X \in \mathbb{R}^{n \times p}$, labels $Y \in \{-1,1\}$, and cost parameter $C \in \mathbb{R}^+$. Within the function, we use the quadratic solver quadprog to solve the SVM dual problem (2) with these parameters to find the optimal α 's. Since quadprog requires that the problem fit into a certain functional form, we reformulate the problem (2) as follows:

$$-\min_{\alpha \in \mathbb{R}^n} \quad \frac{1}{2} \alpha^T H \alpha - \sum_{i=1}^n \alpha_i$$
s.t. $0 \le \alpha_i \le C, \qquad i = 1, \dots, n,$

$$\sum_{i=1}^n \alpha_i y^{(i)} = 0,$$
(2)

where: $H \in \mathbb{R}^{n \times n}$ is a matrix with $(i, j)^{th}$ entry $H_{ij} = y^{(i)}y^{(j)}k(x^{(i)}, x^{(j)})$.

3 Titanic Data

(g) Non-seperable data, training
